

Robusting Cross-blockchain Trading Protocol

Trade most of the tokens/coins on a single portal.

How it all started

The project started in april-2021, When three blockchain developers gathered in London and decided to start a joint adventure . The formation was quick and since the team already knew what was missing in industry, They decided to make a robusting cross-blockchain trading protocol to make life easier for crypto users.

What is project

Cross-blockchain trading protocol will enable users to exchange the cross-blockchain tokens through dragonfly protocol. Imagine you don't need a different swap website for different blockchains and same for dragonfly crypto vault. Unlike metamask you would not need to have different accounts for different block chain tokens. Dragonfly will do it automatically for you.

Dragonfly Token

The **total supply** of token is **999,999** less than a million. Dragonfly token will be used for fee used on dragonfly crypto business. It will start selling on 0.15 usd from 1-august-21. We are expecting token price to hang somewhere between 10-20 usd once development is finished. 20% tokens are allotted for development and promotions which will increase the token price immensely. The Liquidity Pool will be locked and secure.

Dragonfly Token Smart Contract

It's a very basic and simple smart contract. Without any hidden charges. Slippage is almost to zero. Contract will be available as open source on git. It has no malafide _burn, _mint, _lock functions.

Future:

The plan for the future is making a new block chain and having a full dedicated team to look after the project. By the end of 2022 to mid of 2023 Dragonfly will have its own block chain.

Roadmap

It's well-documented on website on following url:
